Forest ecosystems

Tartalom:

- 1 Forests cover a large part of Europe and fulfil multiple functions for society, providing economic, social and environmental benefits, including serving as a key reservoir of biodiversity
 - 2 Old growth natural and semi-natural forests are the most valuable forest type in terms of storing biodiversity (including genetic variety) and carbon
 - 3 Unsustainable forest management, fragmentation, airborne pollution and climate change are major threats to Europe's forest biodiversity
- Unsustainable forest management
- Fragmentation
- Air pollution
- Climate change
- 4 Interacting pressures on forest ecosystems are threatening species and habitats of European interest
 - 5 European countries have taken measures to protect and restore forest biodiversity in Europe
- References and further reading
